

Sample Paper for Complex Systems

First Author

*University Department, University Name
Address City, State ZIP/Zone, Country*

Second Author**Third Author**

*Group, Laboratory
Address
City, State ZIP/Zone, Country*

The abstract should summarize the content of the paper, including its context and conclusions. Make sure that it is possible to understand the abstract without having read the entire paper. Remember that many database systems will access the paper through keywords from the title and abstract. If possible, use the passive voice and avoid personal pronouns in the abstract (“X is shown,” rather than “we show X”), but not if it leads to awkward sentence constructions. Try to keep the abstract below 150 words in length (and shorter for short papers). Do not cite references or display equations in the abstract.

1. Introduction

The title serves as a headline for the paper and many readers will use it to decide whether or not to look at the paper. Avoid excessively general, technical, or cutesy titles. Questions are acceptable as titles. In the title and other headings, capitalize the first letters of important words and proper names only.

Give complete affiliation and mailing address, including country. Use standard two-letter abbreviations for state names. For foreign addresses, give as much as possible in English. Authors are encouraged to give their first names and middle initials. Titles and positions should not be given or implied. Authors are listed by their affiliation. The example given has the first author at one organization and the second and third with a different affiliation. Funding and personal acknowledgments go at the end of the paper in an Acknowledgments section.

The introduction is a crucial part of a paper. It should explain the background and goals and should strive to be as widely accessible as possible. Jargon and abbreviations should be avoided. References to textbooks and other basic material should be cited, for example, as [1–3]. References should be numbered in the order in which they ap-

pear in the text. A space should be left before the brackets used to indicate a citation to a reference. If an arbitrary choice out of many possible references is made, indicate it as (e.g., [3]). It is preferred that author names are not used when referencing their works.

Except for very short papers, division into sections is strongly encouraged. The first section need not necessarily be entitled “Introduction.” There may be subsections as well as sections. Subsubsections should only be used for lengthy papers where more structure is required. All section headings are numbered.

A paper should be long enough to convey its main points to the general readership of *Complex Systems*. It is OK for a paper to be shorter than average. The length of a typical paper is between 20 and 30 pages.

2. Formatting Systems

Authors are encouraged to send electronic media as their submission. Although we prefer that papers be submitted as Wolfram Mathematica notebooks or CDF documents, we can process papers from a variety of other formats, such as LaTeX. Papers prepared using other formatting systems or submitted in hard copy only may have to be retyped, causing delays in processing. This sample paper was prepared with Wolfram Mathematica and can be used as a template. It is available for download at

<http://www.complex-systems.com/contribute.html>.

A LaTeX version is also available.

3. Figures and Other Displays

Figures are an excellent mechanism for communicating many kinds of results. Great care should be taken to produce clear, well-constructed figures. When there are many related graphs or images, they should usually be combined into a single figure.

Figures should be displayed near where they are first mentioned in the text and are numbered sequentially: Figure 1 is an example. All figures should be mentioned in the text.

It is best to send your figures in a “scalable” form such as Wolfram Mathematica Graphics Objects, Encapsulated PostScript (EPS), or Portable Document Format (PDF). Figures can also be processed in “bitmap” formats such as BMP, PICT, or TIFF, but scalable formats generally reproduce better.

Figure 1. An example figure. The first sentence of a figure caption should serve as a title for the figure. The remainder should describe the figure in a way that does not rely on the main text of the paper. Readers may look at the figures and their captions before reading the full text.

Figures should reproduce well (i.e., without noticeable aliasing) on common printers. The source file for a particular figure must include all elements of the figure and should not require modification. Lettering should be consistent throughout a figure and must be no smaller than 8 points when the figure is at final size. Lines should be thick enough that they do not break up under reduction (single-pixel lines rarely suffice). Filled black areas must not drop out. Computer-generated halftones should generally be avoided; if they are used, the original output should be sent. Whenever possible, the figures should be oriented in the same sense as text (portrait mode).

Black-and-white photographs should be sent as original prints; they will be reproduced using halftones. Multiple photographs in a single figure should be sent as a single print if possible.

Computer programs or algorithm descriptions may be given either in equations or in figures. Literal expressions that occur as computer input or output should be given in `typewriter` font.

Tables should include captions similar to those for figures and should be numbered sequentially throughout the paper. Tables must be oriented with the text and use 9 point type, and should be enclosed by a box.

First	Second	Third Part
data	Ω	
<code>more</code>	$\Pi + 1$	end

Table 1. A sample table. Avoid using tables for numerical data; figures usually present such material more meaningfully. Also avoid putting extensive text into tables. Column headings should follow title capitalization rules.

4. The Main Text

Good English grammar is essential. Authors not fluent in English are strongly encouraged to have their grammar checked. American spelling should be used and, if possible, checked by computer. Contractions such as “weren’t” should never be used, nor should exclamation marks.

Acronyms should be spelled out at their first use and given in capitals thereafter: cellular automaton (CA for singular), cellular automata (CAs for plural). Avoid introducing too many acronyms. Spell out abbreviations when they are first used. Spell out integers under 10 unless they are used with units of measure or begin a sentence (i.e., write “two” rather than “2” but use “2 miles”).

Italicize defined terms when they are introduced. Also italicize foreign language phrases on first use, if they are likely to be unfamiliar to the reader. The abbreviations “e.g.,” “i.e.,” and “etc.” should not be italicized and should be used only in parenthetical material; spell out “for example,” “that is,” and “and so forth” (or equivalents) in regular text.

Cross-references can be made to other sections in the paper (e.g., Section 1) and to other numbered elements. When referencing displayed formulas use, for example, equation (1). Footnotes should be avoided. Points worth making should appear in the main text.

Lists of items should be preceded by a complete sentence and may be laid out as follows.

- Each item will be like a separate paragraph.
- Another item.

If a list of items is given in the text, such as: (*a*) first item; (*b*) second item; and so forth, they should be indicated with parenthesized letters in italic typeface.

5. Equations and Mathematical Symbols

Consistent mathematical notation is essential to clear exposition. Try to use familiar notation; for example, avoid having x stand for an integer index.

All standard mathematical symbols and notations must be formatted in equation form, whether inline or displayed. Even standard English letters such as x must appear as x (mathematical font) if they correspond to mathematical symbols. Use roman for abbreviations in equations, for example, $\sin(x)$.

Displayed equations that are referenced in the text should be numbered sequentially:

$$e^{2\pi i} = 1. \tag{1}$$

Spaces should be inserted in equations where necessary to improve readability. Equations should be referred to as “equation (1).” In multiple-line equations, the number should be given on the last line. Short equations may be inserted directly in the text, as in $\beta = 2$. Equations that involve extensive subscripts, superscripts, or built-up objects should be displayed. Special symbols in equations must be strictly limited to those that can be produced with Wolfram Mathematica using common fonts.

If a formatting system other than Wolfram Mathematica or LaTeX is used, make sure that all symbols are very clearly identified, and that all subscripts and superscripts are evident. *Complex Systems* allows many kinds of notation. It is suggested that symbols or words related to actual or theoretical computers be indicated in `typewriter` font.

Great care should be taken in mixing plain English, mathematics, and algorithm descriptions. Say, for example, “ x is the position” rather than “ $x = \text{position}$.” Consistency must be maintained between different occurrences of a symbol. If x is a mathematical symbol, make sure it appears as x everywhere, not sometimes as x or as x . As a rough guide, mathematical symbols should appear as x and computer symbols as `x`.

Theorem 1. Theorems and other structured mathematical text should be used when it improves the presentation. They should not be a substitute for clear English exposition.

Proof. Proofs can continue for several paragraphs. They should end with an empty square. \square

Acknowledgments

Acknowledgments should thank individuals and organizations for their contributions to the work. All funding information should be placed in the acknowledgments. If acknowledgments imply some endorsement of the paper (e.g., “We thank X for checking...”) make sure the parties involved approve the statements made.

Appendix

A. About the References

Appendices should be used to give detailed or background information related to the main text. Display equations in appendices should be cross-referenced as equation (A.1) and so forth:

$$e^{2\pi i} = 1. \quad (\text{A.1})$$

References should give pointers to background material and related work. They should record credit due to other authors.

References are numbered sequentially throughout the text. Each item should be given a separate number (except when citations are made to different portions of the same document: these should be indicated as “[2, pp. 3–56]” or “[2, Chapter 14]”).

Full titles of papers should be given. They should be enclosed in quotation marks, with all important words capitalized. Titles of printed items should be followed by a comma inside the quotation marks. Include the paper’s digital object identifier (DOI) name (number) if it is available (<http://www.doi.org/hb.html>). Titles accessible only via the internet are treated differently based on their type. See the examples described in the References.

To cater to a wide variety of disciplines, it is important that *all names of journals be spelled out in full and italicized.* (Use *Physical Review Letters*, not *Phys. Rev. Lett.*, and *Journal of Computer and System Science*, not *J. Comput. Sys. Sci.*)

For printed items, give the journal’s volume number in boldface (do not write the word “volume” explicitly). The issue number should be placed in parentheses immediately following the volume number, but not in bold: for example, **4**(1). Include months only when necessary, using their three-letter abbreviation. Give starting and ending page numbers.

Author names should be given with initials first, with spaces after each period. For sources that list several authors, the name of the first author should be given, followed by “et al.,” but listing all names is preferred.

Titles of books (i.e., published material with ISBN numbers) should be italicized. Names and cities of publishers and dates of publication should always be given. Conference proceedings that are distributed through ordinary publishers should be cited like books.

Titles of proceedings and reports that are distributed in other ways or via the internet should be given in full in the standard roman typeface. URLs or other information on how to obtain them should be given following the title. Pricing information should not be included.
